

# Effect of Trace Contaminants and Progeny On Hazard Categorizations Assessments

---

Presented by:

Bill Walker & Melanie Bartholomay

WSMS-MA / Oak Ridge National Laboratory

May 23<sup>rd</sup>, 2007

EFOCG Safety Analysis Working Group

# Outline

---

- Contaminants
  - Definition
  - Examples
- Progeny
  - Definition
  - Relationship to HC-3 TQs
  - Examples
- Summary

# Contaminants

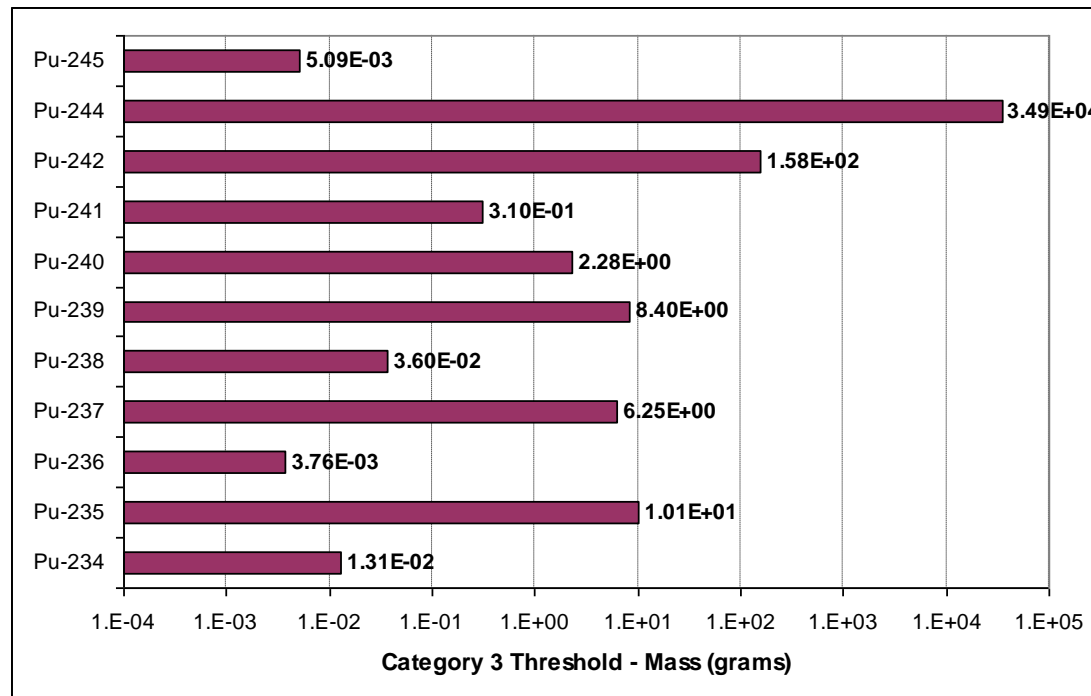

---

- Definition:

- Radioactive impurities
- Usually found in trace amounts in chemically purified radioactive materials.
- Also present in naturally occurring radioactive materials
- NOT to be confused with the Health Physics term “Contamination”.
  - This is a radiochemical purity issue.

# Contaminants – What's The Big Deal?

- If typically present in trace amounts, then why bother?
  - Because not all TQs (activity / mass) are equal.

# $^{238}\text{Pu}$ and $^{239}\text{Pu}$ – How each impacts the other as a contaminant

# Contaminant Example – Monsanto

## $^{239}\text{Pu}$ / Be Sources

---

- Monsanto Research Corporation (MRC) fabricated Pu/Be sources in the 1950's and 1960's
  - Pu/Be sources are used as neutron sources.
  - Paper written in 1968 noted increase in neutron flux from  $^{239}\text{Pu}$ /Be sources was due to  $^{241}\text{Pu}$  contamination<sup>(1)</sup>.
    - $^{241}\text{Pu}(\beta) \rightarrow ^{241}\text{Am}(\alpha) \rightarrow ^{237}\text{Np} \dots \text{etc}$

# Contaminant Example – Monsanto

## $^{239}\text{Pu}$ / Be Sources (con't)

Description	Isotope	Atomic Abundance	Activity Abundance	HC-3 TQ (Ci)	SOF / mCi – Pu	% of Total HC-3 SOF
Monsanto $^{239}\text{Pu}$ /Be Neutron Source	$^{238}\text{Pu}$	0.01%	0.21%	6.20E-01	3.42E-06	1.6%
	$^{239}\text{Pu}$	91.6%	7.09%	5.20E-01	1.36E-04	64.9%
	$^{240}\text{Pu}$	7.7%	2.19%	5.20E-01	4.22E-05	20.1%
	$^{241}\text{Pu}$	0.7%	90.50%	3.20E+01	2.83E-05	13.4%
					$f_{\text{SOF}}$	1.54

Monsanto  $^{239}\text{Pu}$ /Be Sources

# Contaminant Example – Chemically Separated Natural Uranium

---

- Natural Uranium Radiochemical Purity
  - ~18,000 times more  $^{238}\text{U}$  than  $^{234}\text{U}$  (by weight).
  - HC-3 TQ for  $^{234}\text{U}$  is ~19,000 smaller than the HC-3 TQ for  $^{238}\text{U}$ .
    - $^{234}\text{U}$  contribution to HC-3 SOF assessment can be greater than the  $^{238}\text{U}$  contribution

<u>Isotope</u>	<u>Wt %</u>	<u>HC-3 TQ (g)</u>	<u>% of Total SOF</u>
$^{238}\text{U}$	99.7823	1.30E+07	48.2%
$^{235}\text{U}$	0.072	1.90E+06	0.2%
$^{234}\text{U}$	0.0055	6.70E+02	51.6%

# $^{234}\text{U}$ Content In Spectrum of Uranium Source Material

# $^{234}\text{U}$ Content Haz Cat Effect On Various Uranium Grades

Description	Isotope	Activity Abundance	HC-3 TQ (Ci)	SOF / Ci – U
Depleted – Uranium (0.25% mass $^{235}\text{U}$ )	$^{234}\text{U}$	8.4%	4.2	2.00E-02
	$^{235}\text{U}$	1.5%	4.2	3.57E-03
	$^{238}\text{U}$	90.1%	4.2	2.15E-01
				$f_{\text{SOF}}$
Natural – Uranium (0.72% mass $^{235}\text{U}$ )	$^{234}\text{U}$	48.83%	4.2	1.16E-01
	$^{235}\text{U}$	2.34%	4.2	5.57E-03
	$^{238}\text{U}$	48.83%	4.2	1.16E-01
				$f_{\text{SOF}}$
Enriched (5 wt%) – $\text{UF}_6$ ( $10 \times 10^3 \mu\text{g } ^{234}\text{U}/\text{g}^{235}\text{U}$ )	$^{234}\text{U}$	87.98%	4.2	2.09E-01
	$^{235}\text{U}$	3.04%	4.2	7.24E-03
	$^{238}\text{U}$	8.98%	4.2	2.14E-02
				$f_{\text{SOF}}$
	Isotope	Mass Abundance	HC-3 TQ (Ci)	SOF / Ci – U
Enriched (2 wt%) – $\text{UF}_6$ ( $11 \times 10^3 \mu\text{g } ^{234}\text{U}/\text{g}^{235}\text{U}$ )	$^{232}\text{U}$	1.00E-10	0.82	1.48E-03
	$^{234}\text{U}$	0.02%	4.2	1.85E-01
	$^{235}\text{U}$	2.00%	4.2	5.83E-03
	$^{236}\text{U}$	2.50E-04	4.2	2.18E-03
	$^{238}\text{U}$	97.95%	4.2	4.44E-02
				$f_{\text{SOF}}$

# Other Contaminant Examples – $^{241}\text{Am}$

- $^{241}\text{Am}$  Source Material
  - $^{242\text{m}}\text{Am}$  and  $^{243}\text{Am}$  are expected contaminants
    - Up to 0.4 wt%  $^{242\text{m}}\text{Am}$  from LWR<sup>(2)</sup>
    - Minimal HC-3 SOF impact ( $f_{\text{SOF}} = 1.01$ )
    - Significant  $^{235}\text{U}$  FEM contributor

Nuclide	Mass (g)	FEM Factor	FEM (g)
$^{241}\text{Am}$	0.95	0.044	4.18E-02
$^{242\text{m}}\text{Am}$	0.004	54	2.16E-01
$^{243}\text{Am}$	0.046	0.028	1.29E-03
<b>TOTAL FEM</b>			<b>2.59E-01</b>
$f_{\text{FEM}}$			6.20E+00

# Progeny

---

- Definition:

- Radioactive isotopes created through the natural radioactive decay of a parent radioisotope.
- Also referred to as “daughter” isotopes.

# What is the Role of Progeny In Haz Cat Assessments?

---

- HC-3 TQs only includes the dose contribution of progeny that is produced within the body (ICRP-30)
  - ICRP-30 (ALIs) →
  - EPA RQs →
  - DOE HC-3 TQs !
- Progeny produced outside of the body would not be accounted for in the derivation of the ALIs.
  - Progeny that contribute to dose and are present in facility inventory must be addressed in HC-3 Haz Cat assessment.

# Methodology for assessing progeny

---

- Screening criteria
  - 757 Radioisotopes with HC-3 TQs
    - Radioisotopes w/  $T_{1/2} > 0.25\text{yr}$
    - Radioactive progeny
      - 79 radioisotopes left after screening
- Calculation of progeny impact of HC-3 SOF
  - Used Bateman Equations
  - Identified parents that had  $f_{\text{SOF}}$  factor greater than or equal to 1.10 within 100 years.
    - 37 Radioisotopes
- Two classes of progeny impact
  - Secular equilibrium
    - (SOF increases, then decreases)
  - Non-secular equilibrium
    - (SOF decreases slower than expected)

# Progeny In Secular Equilibrium (N, N+1, N+2 and N+3 series)

Isotope	Decay Series	$f_{\text{SOF}}$ @ 100 yr	Significant Progeny Contributing to $f_{\text{SOF}}$ (% of SOF @ 100 yr in-growth)
$^{232}\text{Th}$	$^{232}\text{Th}$ Series (N)	1.16E+00	$^{228}\text{Ra}$ (0.7%), <b><math>^{228}\text{Th}</math> (8.6%)</b> , <b><math>^{220}\text{Rn}</math> (4.3%)</b>
$^{228}\text{Th}$	$^{232}\text{Th}$ Series (N)	1.56E+00	$^{224}\text{Ra}$ (0.3%), <b><math>^{220}\text{Rn}</math> (32.2%)</b> , $^{212}\text{Pb}$ (0.2%), <b><math>^{208}\text{Tl}</math> (3.2%)</b>
$^{232}\text{U}$	$^{232}\text{Th}$ Series (N)	2.34E+00	<b><math>^{228}\text{Th}</math> (36.0%)</b> , $^{224}\text{Ra}$ (0.2%), <b><math>^{220}\text{Rn}</math> (19.0%)</b> , $^{212}\text{Pb}$ (0.1%), <b><math>^{208}\text{Tl}</math> (1.9%)</b>
$^{228}\text{Ra}$	$^{232}\text{Th}$ Series (N)	2.90E+01	<b><math>^{228}\text{Th}</math> (61.9%)</b> , $^{224}\text{Ra}$ (0.3%), <b><math>^{220}\text{Rn}</math> (31.0%)</b> , $^{212}\text{Pb}$ (0.2%), <b><math>^{208}\text{Tl}</math> (3.1%)</b>
$^{245}\text{Cm}$	$^{233}\text{U}$ Series (N+1)	1.14E+00	$^{245}\text{Pu}$ (1.4%), <b><math>^{241}\text{Am}</math> (10.5%)</b>
$^{233}\text{U}$	$^{233}\text{U}$ Series (N+1)	1.42E+00	<b><math>^{229}\text{Th}</math> (29.7%)</b> , $^{225}\text{Ac}$ (0.1%)
$^{210}\text{Pb}$	$^{238}\text{U}$ Series (N+2)	1.19E+00	$^{210}\text{Bi}$ (0.1%), <b><math>^{210}\text{Po}</math> (5.1%)</b>
$^{242\text{m}}\text{Am}$	$^{238}\text{U}$ Series (N+2)	1.48E+01	$^{242}\text{Cm}$ (0.9%), <b><math>^{238}\text{Pu}</math> (31.4%)</b>
$^{226}\text{Ra}$	$^{238}\text{U}$ Series (N+2)	<b>4.06E+01</b>	$^{222}\text{Rn}$ (3.0%), <b><math>^{210}\text{Pb}</math> (79.4%)</b> , $^{210}\text{Bi}$ (0.1%), <b><math>^{210}\text{Po}</math> (15.0%)</b>
$^{235}\text{U}$	$^{235}\text{U}$ Series (N+3)	1.19E+00	$^{231}\text{Pa}$ (3.7%), <b><math>^{227}\text{Ac}</math> (12.4%)</b>
$^{231}\text{Pa}$	$^{235}\text{U}$ Series (N+3)	5.58E+00	<b><math>^{227}\text{Ac}</math> (81.9%)</b> , $^{227}\text{Th}$ (0.1%), $^{223}\text{Ra}$ (0.1%)

# Significant Progeny Not In Secular Equilibrium

---

- Parent decays into a longer lived progeny.
  - 17 parents had longer-lived progeny with  $f_{\text{SOF}} > 1.10$ .
    - 11 were transuranium isotopes.
  - Selected examples (where  $f_{\text{SOF}} = 1.10$ ):
    - $^{241}\text{Pu}$  ( $t_{1/2} = 14.4$  y)  $\rightarrow$   $^{241}\text{Am}$  @ 1.0 year
    - $^{244}\text{Cm}$  ( $t_{1/2} = 18.1$  y)  $\rightarrow$   $^{240}\text{Pu}$  @ 77 years
    - $^{250}\text{Cf}$  ( $t_{1/2} = 13.1$  y)  $\rightarrow$   $^{246}\text{Cm}$  @ 55 years
- The SOF of mixture typically decreases over time, just not as fast due to progeny build-in.
  - Exception:
    - $^{241}\text{Pu}$  decay into  $^{241}\text{Am}$ .
      - Overall SOF increase of 1.86 times (@ 55 y).

# Four EPA Defined Mixtures

---

- The EPA defines mixture RQs for four defined radioactive material mixtures:
  - Natural U (chemical separated)
  - Natural U in secular equil. w/ progeny
  - Natural Thorium
  - $^{226}\text{Ra}$  in secular equil. w/ progeny

# An HC-3 Analysis of the Four EPA Defined Mixtures

---

- Nat U – Chemically Separated

- $^{238}\text{U}$ ,  $^{235}\text{U}$ ,  $^{234}\text{U}$
- No progeny
- $f_{\text{SOF}} = 2.2$

- Natural Thorium

- $^{232}\text{Th}$  and  $^{228}\text{Th}$
- $f_{\text{SOF}} = 1.16$

---

- Nat U w/ progeny

- Characteristic of uranium ore.
- $^{238}\text{U}$ ,  $^{235}\text{U}$ ,  $^{234}\text{U}$  and associated progeny in sec. equil.
- $f_{\text{SOF}} = 29.3$

- $^{226}\text{Ra}$  w/ progeny

- $^{226}\text{Ra}$  and associated progeny in sec. equil.
- $f_{\text{SOF}} = 41.9$

# Contaminants Summary

---

- Be ready to ask the following:
  - Where did the source come from / who fabricated the source?
    - NORM
    - Reactor (LWR vs. HWR, Commercial vs. High Neutron Flux)
    - Accelerator
  - How was the source material produced?
    - Contaminant composition can be influenced by:
      - Isotopic composition of starting material
      - Irradiation history
      - Chemical purification techniques
  - How old is the source?
    - In-growth issues can impact SOF and FEM assessment
- What to look for:
  - Contaminants with HC-3 SOF TQs smaller than the predominant isotope.
  - Contaminants with  $^{235}\text{U}$  FEM factor larger than the predominant isotope.
    - Also applies to  $^{239}\text{Pu}$  FGE assessments.

# Progeny Summary

---

- Progeny in secular equilibrium results in higher SOF.
- Progeny in non-secular equilibrium typically has SOF decrease at slower rate.
  - Beware of the exceptions:
  - $^{241}\text{Pu} \rightarrow ^{241}\text{Am}$  build-in increases starting HC-3 SOF by 1.86 times (55y).
